

**Typical School Bus Air System Schematic  
with a Bendix® AD-IS® Air Dryer**

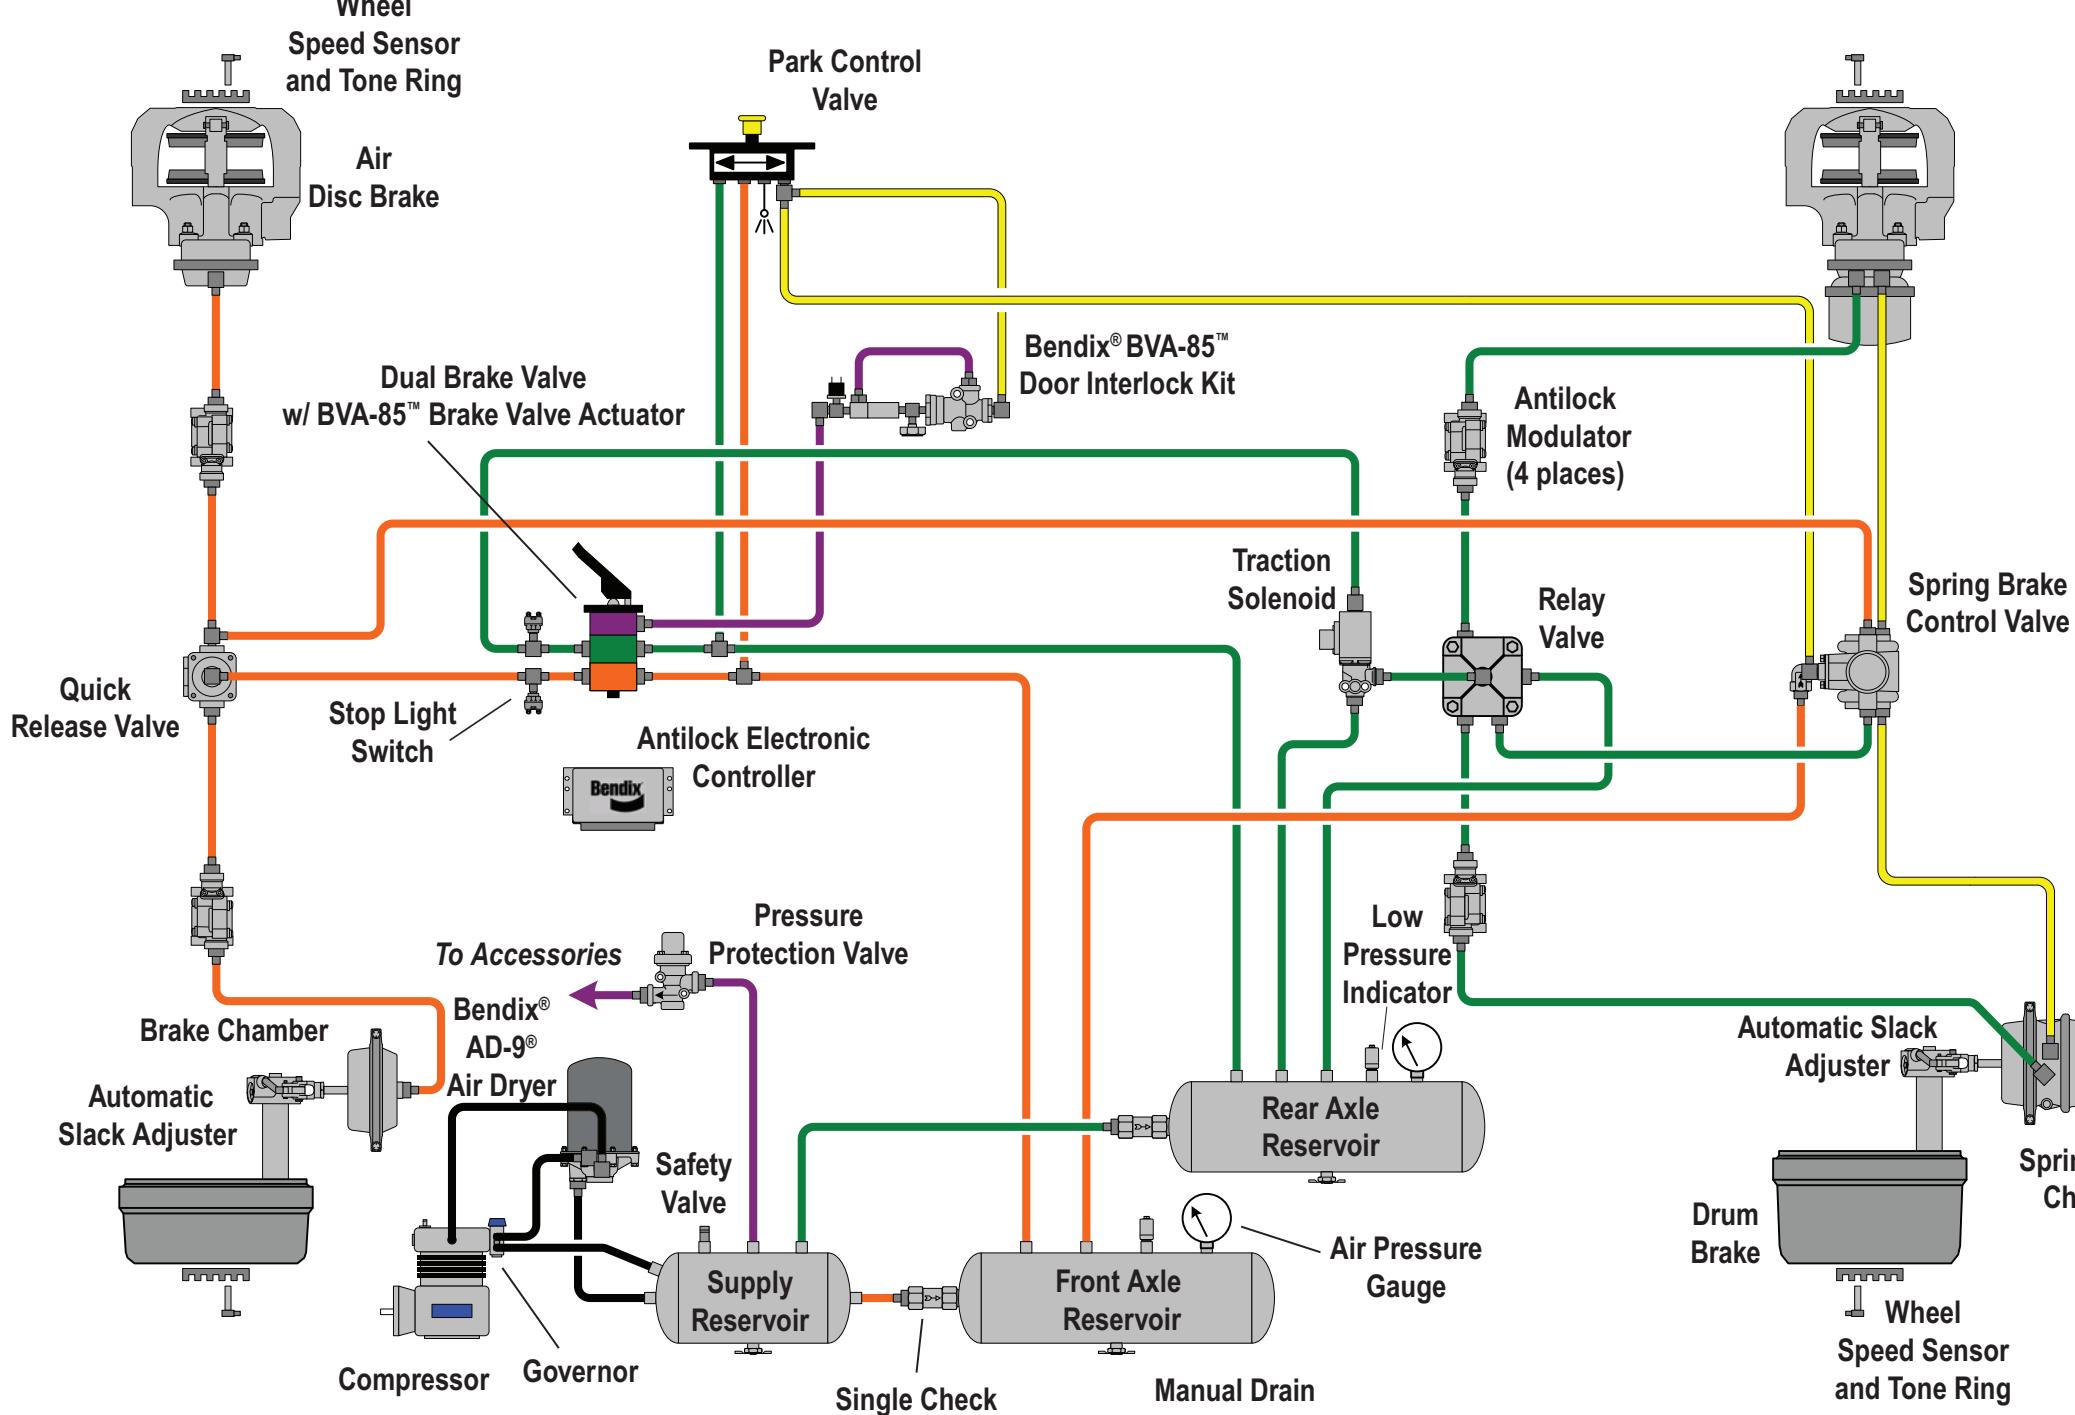

# School Bus Air Brake System Troubleshooting

## Coach and School Bus:

Charging Primary Secondary Parking (Control) Accessories

**Notes:**  
The color coding of the brake system schematic follows TMC Recommended Practice #423. Air disc & drum brake actuation combined on a single axle are shown for pictorial purposes only.

**Typical School Bus Air System Schematic  
with a Bendix® AD-9® Air Dryer**

**TEST 1**  
Governor cut-out / Low pressure warning / Pressure build-up  
**VEHICLE PARKED, WHEELS CHOCKED**

<input checked="" type="checkbox"/> OK	<input type="checkbox"/> Not OK
1. Drain all the reservoirs to 0 psi.	
2. Start the engine and run at fast idle. The low pressure warning should be on. Note: On vehicles equipped with ABS, the warning lamp will also come on momentarily when the ignition is turned on. On some systems, such as the Bendix® AD-IS® dryer system (illustrated), reservoirs may not fill simultaneously and one reservoir may fill to 110 psi before the other starts to fill.	
3. Low pressure warning: dash warning lamp should go off above 60 psi.	
4. Build up time: pressure should build from 85-100 psi within 40 seconds.	
5. Governor cut-out: cuts-out at the correct pressure, 135 psi (maximum).	
6. Governor cut-in: reduce the service air pressure to governor cut-in. The difference between cut-in and cut-out pressure must not exceed 30 psi.	

MAKE ALL THE NECESSARY REPAIRS BEFORE PROCEEDING TO TEST 2;  
SEE CHECKLIST 1 FOR COMMON CORRECTIONS.

**CHECKLIST 1**

If the low pressure warning lamp or buzzer doesn't come on:

- Check the warning lamp wiring.
- Check the warning lamp bulb.
- Repair or replace the buzzer, bulb, or low pressure warning switch(es).

If the governor cut-out is higher or lower than specified by the vehicle manual:

- Repair, replace or adjust the governor as necessary after ensuring the compressor unloader mechanism is operating correctly.

If the low pressure warning occurs below 60 psi:

- Check the dash gauge with test gauge known to be accurate.
- Repair or replace the faulty low pressure indicator switch.

If the compressor build up time exceeds 40 seconds or is considerably greater than the permanent record figure:

- Examine the compressor air inlet filter and inlet line for restrictions, damage or wear. Clean or replace the filter or inlet line as necessary.
- Check the compressor discharge port and line for excessive carbon. Clean or replace the discharge line as necessary. If carbon is present, find the cause of the excessive heat.
- With the system fully charged and governor in the unloaded mode, listen at the compressor inlet for leakage. If leakage can be heard, remove the unloaders and repair or replace as necessary.

**RETEST TO VERIFY PROPER OPERATION OF ALL ITEMS  
REPAIRED OR REPLACED.**

**TEST 2**  
Leakage (reservoir air supply)  
For additional information refer to the video, Assessing Air Brake System Air Leakage (Bendix® part number BW2327 - CD)

<input checked="" type="checkbox"/> OK	<input type="checkbox"/> Not OK
1. Allow the air pressure to stabilize for at least 1 minute.	
2. Observe the dash gauge pressures for 2 minutes and note any pressure drop. A 4 psi drop within 2 minutes is allowable for either service reservoir.	

MAKE ALL NECESSARY REPAIRS BEFORE PROCEEDING TO TEST 3;  
SEE CHECKLIST 2 FOR COMMON CORRECTIONS.

If there is excessive leakage in the supply side of the pneumatic system, one or more of the following devices could be causing the problem:

Note: A leak detector or soap solution will aid in locating the faulty component.

- Supply lines and fittings
- Low pressure indicator(s)
- Service brake relay valve(s)
- Spring brake relay valve (where applicable)
- Dual brake valve
- Park control valve
- System safety valve(s) in the supply reservoir and/or air dryer
- Governor (may be mounted on the air dryer as illustrated, on the compressor, or remotely)
- Compressor discharge line

**RETEST TO VERIFY PROPER OPERATION OF ALL ITEMS  
REPAIRED OR REPLACED.**

**TEST 3**  
Pressure Modulator Valve and Traction Control Valve Chuff  
**FULL PRESSURE, ENGINE STOPPED, PARKING BRAKES RELEASED**

<input checked="" type="checkbox"/> OK	<input type="checkbox"/> Not OK
If there is excessive leakage in the service side of the pneumatic system, one or more of the following devices could be causing the problem: NOTE: A leak detector or soap solution will aid in locating the faulty component.	
1. Make and hold a brake application. When ignition power is applied, each pressure modulator valve (PMV) solenoid is briefly energized. If the air system is fully charged and the service brake pedal is depressed during ignition, the modulator creates a single, sharp audible "chuff" of air pressure. The modulators are energized in a certain pattern, as follows: right front, left front, right rear, left rear. This test is performed only when the vehicle is stationary (if the vehicle moves the chuff test will not be performed). NOTE: The Bendix® EC-60™ electronic controller will perform a pressure modulator valve (PMV) chuff test on all installed modulators in the following order: 1. Steer Axle Right PMV 2. Steer Axle Left PMV 3. Drive Axle Right PMV 4. Drive Axle Left PMV 5. Additional Axle Right PMV 6. Additional Axle Left PMV 7. Drive Axle Traction Control Valve (TCV) The pattern will then repeat itself. See appropriate Service Data Sheet for repairs.	

MAKE ALL NECESSARY REPAIRS BEFORE PROCEEDING TO TEST 4.

**TEST 4**  
Leakage service air delivery  
**FULL PRESSURE, ENGINE STOPPED, PARKING BRAKES RELEASED**

<input checked="" type="checkbox"/> OK	<input type="checkbox"/> Not OK
1. Make and hold an 80-90 psi brake application. This can be accomplished by using the Bendix® BVA-85™ brake valve actuator. If the vehicle is not equipped with a BVA-85™ brake valve actuator, an assistant should be used to maintain a constant brake application during these tests.	
2. Allow pressure to stabilize for 1 minute; then begin timing for 2 minutes while watching the dash gauges for a pressure drop. A 4 psi drop within 2 minutes is allowable for either service reservoir.	
3. Check brake chamber push rod travel (refer to chart for allowable tolerances). With the parking brakes released and service brakes applied with 80 to 90 psi of air pressure to the service chambers.	

Brake Chamber Size	Maximum Allowable Stroke	Max Allowable Stroke - Long Stroke
12	1-3/8"	1-3/4"
16	1-3/4"	2"
20	1-3/4"	2"
24	1-3/4"	2"
24 (Max Stroke)	-	2-1/2"
30	2"	2-1/2"

MAKE ALL NECESSARY REPAIRS BEFORE PROCEEDING TO TEST 5;  
SEE CHECKLIST 5 FOR COMMON CORRECTIONS.

**TEST 5**  
Manual Parking Brake Operation  
**FULL PRESSURE, ENGINE IDLING 600-900 RPM**

<input checked="" type="checkbox"/> OK	<input type="checkbox"/> Not OK
Manually operate the park control, yellow button valve, and note that the brakes apply and release promptly as the control valve button is pulled out and pushed in.	

MAKE ALL NECESSARY REPAIRS BEFORE PROCEEDING TO TEST 6;  
SEE CHECKLIST 6 FOR COMMON CORRECTIONS.

**TEST 6**  
Dual circuit system integrity check (emergency braking) and/or automatic application of the parking brake  
**FULL PRESSURE, ENGINE STOPPED, PARKING BRAKES RELEASED**

<input checked="" type="checkbox"/> OK	<input type="checkbox"/> Not OK
1. Drain the front axle or secondary reservoir to 0 psi. The rear axle or primary reservoir should retain most of its pressure.	
2. With no air pressure in the front axle reservoir, make a brake application. A. The rear axle brakes should apply and release when the application is released. B. The stop lamps should light and go off when the application is released.	

**TEST 6**  
"Pop" Pressure Vehicle Test Procedure

Note: The optional Bendix® BVA-85™ actuator for Bendix® E-6™, E-8P™, and E-10™-based brake valve configurations, plus the door interlock kit (P.C. No. K036675), is intended to provide an approximately 40 psi service brake application to all wheels when following conditions are met:

- Passenger door is open
- RED crossing flashers are ON
- Vehicle speed is below 3 mph

Indication is provided to the operator in the event that the control pressure to the BVA-85™ actuator drops below the minimum pressure required to hold the bus.

continued ...

**CHECKLIST 4**

If there is excessive leakage in the service side of the pneumatic system, one or more of the following devices could be causing the problem:  
NOTE: A leak detector or soap solution will aid in locating the faulty component.

- Loose service lines and fittings
- Park control valve
- Stop light switch
- Spring brake chamber, service chamber and/or brake chamber diaphragms
- Service brake relay valves
- Dual brake valve
- Inverting relay spring brake control valve (where applicable – usually found on the spring brake relay valve) straight trucks and buses
- Double check valve

If the automatic slack adjuster is not adjusting, repair or replace to obtain the desired setting.

CAUTION: If the brake chamber push rod travel does not make the allowable stroke, identify and correct the root cause of the excess stroke. Do not make manual adjustments of an automatic slack adjuster once it can no longer automatically adjust the brakes. Manual adjustment DOES NOT fix the underlying wheel-end adjustment. As soon as possible, have the vehicle inspected by a qualified technician or consult the manufacturer's troubleshooting guidelines to find and fix the problem.

MAKE ALL THE NECESSARY REPAIRS BEFORE PROCEEDING TO TEST 6 Continued

**CHECKLIST 6**

If the vehicle fails to pass the tests outlined, then check the following components for leakage and proper operation:

- Fittings
  - Kinked hose or tubing
  - Pressure protection valves
  - Double check valves
  - Parking control valve
  - Relay valves (antilock modulators)
  - Inverting relay spring brake control valve (optional)
- RETEST TO VERIFY PROPER OPERATION OF ALL ITEMS REPAIRED OR REPLACED.

**GENERAL SAFETY GUIDELINES**

**WARNING! PLEASE READ AND FOLLOW THESE INSTRUCTIONS TO AVOID PERSONAL INJURY OR DEATH:**

When working on or around a vehicle, the following general precautions should be observed at all times:

- Never exceed manufacturer's recommended pressures.
- Never connect or disconnect a hose or line containing pressure; it may whip. Never remove a component or plug unless you are certain all system pressure has been depleted.
- Never connect or disconnect a hose or line containing pressure; it may whip. Never remove a component or plug unless you are certain all system pressure has been depleted.
- Use only genuine Bendix® brand replacement parts, components and kits. Replacement hardware, tubing, hose, fittings, etc. must be of equivalent size, type and strength as original equipment and be designed specifically for such applications and systems.
- Components with stripped threads or damaged parts should be replaced rather than repaired. Do not attempt repairs requiring machining or welding unless specifically stated and approved by the vehicle and component manufacturer.
- Prior to returning the vehicle to service, make certain all components and systems are restored to their proper operating condition.
- For vehicles with Automatic Traction Control (ATC), the ATC function must be disabled (ATC indicator lamp should be ON) prior to performing any vehicle maintenance where one or more wheels on a drive axle are lifted off the ground and moving.

**Specify genuine Bendix® brand replacement parts every time you service your air brake system.**

- All genuine Bendix® brand replacement parts are manufactured to meet original OE specifications to guarantee quality, reliability and proper operating performance.
- Rely on genuine Bendix® brand replacement parts to keep your Air Brake System operating efficiently.
- With thousands of authorized Bendix Parts Outlets across North America, you're never far from quality genuine Bendix® brand replacement parts.
